Ferrule Shield Extraction Spacer

The ferrule shield is an essential re-shafting tool as it's designed to keep the ferrule cool with the help of a water soaked sponge inserted between the shield and ferrule prior to heating up the hosel. The shield also provides a shoulder on which to push against when pulling the shaft out.

▲ The spacer is rigid enough to push against the hosel when removing shafts.

▲ The kit also includes a skewer for heating up the hosel from the inside of the broken shaft.
